Grotius Pocket Algoritme Approach, Designed and written by a linux user, Github Grotius-CNC

| Date: 25-06-2020 |  |
| :---: | :---: |
| Preproccesing: | Split up all primitives as lines, arc's, that are passing intersection points to primitives beween Intersection points, the list must be ordered. |
| Given data: | 1.Primitive numbers ( $p$ ), a primitive can be a line, arc, linestrip, spline etc <br> 2.Primitive end intersection (I) |
| Algoritme rules: | 1. Incrementing a sector number, may only be incremented to a number not containing the closed sector list <br> 2. Decrementing a vector number, must be decremented to a number not containing the closed sector list <br> 3.A sector is closed when the primitive end intersection is seen for the second time, the I number is send to The cs list <br> 4. When a primitive has a end intersection, <br> This is marked in the Action (a) list as $\mathrm{S}++$ (sector increase) or S -- (sector decrease) <br> 5. When a Intersection (I) is spotted for the first time, <br> The action is $\mathrm{S}^{++}$. When a intersection (I) is spotted for the second time, the action is S -- |
| C++ input data : | std::vector<std:::vector<int>> id; 2d container that holds the <br> id $[$ index $][0]=$ primitive $(p)$ Primitive number and the primitive end intersection <br>  The first dataplace will be the primitive $(p)$ number <br> id [ index $][1]=$ primitive end intersection (I) The second dataplace will be |
| C++ output data : | std::vector<std:::vector<std::vector<int>>> od; 3d container that holds the <br> Area, the sector number, including their primitives  <br> $\operatorname{od}[$ index $][0]=$ area (s) The first dataplace will contain the Area of the sector <br> $\operatorname{od}[\operatorname{index}][0]=$ sector $(\mathrm{s})$ The second dataplace will contain the sector number (s) <br> $\operatorname{od}[\operatorname{index}][1]=$ primitive $(p)$ The thirth dataplace will be the primitive (p) number |
| C++ closed sector data : | std::vector<int> cs; Closed sector list. |
| C++ variable | int a; Action, 0=no action, 1=increase, 2=decrease <br> int s; Sector, will hold the current sector |

| Primitives (p) | Primitive end intersection (l) | Sector (s) | Action (a) | Closed Sectors (cs) |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | s++ |  |
| 1 | 0 | 1 | S-- | 1 |
| 2 | 1 | 0 | s++ |  |
| 3 | 1 | 2 | S-- | 2 |
| 4 | 2 | 0 | s++ |  |
| 5 | 2 | 3 | s-- | 3 |
| 6 | 3 | 0 | s++ |  |
| 7 | 3 | 4 | s-- | 4 |

The color flags are defining the steps to do at each row:
Solution:

| Sector (s) | Primitives (p) | Area (a) | Cw |  |
| :--- | :--- | :--- | :--- | :--- |
| 0 | $0,2,4,6$ | $<0$ | Ccw |  |
| 1 | 1 | $>0$ |  | x |
| 2 | 3 | $>0$ | $x$ |  |
| 3 | 5 | $>0$ | $x$ |  |
| 4 | 7 | $>0$ | $x$ |  |

## Comment:

At $p(0)$ we have a end intersection $I(0)$, when we spot a new, unused intersection as $I(0)$, we increase the sector incremented by 1 with a unused sector number. If the sector number was used before, we increment until we have a unused sector number.

At $p(1)$ we spot a already used $i(0)$, so we decrease. We look in the closed sector list, we can not use $\operatorname{cs}(1)$, this was used before, We decrease to 0 .

Sheet1

Example 2:

Page 3

Sheet1

| Primitives (p) | Primitive end intersection (I) | Sector (s) | Action (a) | Closed Sectors (cs) |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | s++ |  |
| 1 | 1 | 1 | S++ |  |
| 2 |  | 2 |  |  |
| 3 |  | 2 |  |  |
| 4 | 1 | 2 | S-- | 2 |
| 5 | 2 | 1 | S++ |  |
| 6 | 3 | 3 | S++ |  |
| 7 | 4 | 4 | S++ |  |
| 8 |  | 5 |  |  |
| 9 |  | 5 |  |  |
| 10 | 4 | 5 | S-- | 5 |
| 11 | 5 | 4 | s++ |  |
| 12 |  | 6 |  |  |
| 13 |  | 6 |  |  |
| 14 | 5 | 6 | S-- | 6 |
| 15 | 3 | 4 | S-- | 4 |
| 16 | 2 | 3 | S-- | 3 |
| 17 | 0 | 1 | S-- | 1 |
| 18 |  | 0 |  |  |
| 19 |  | 0 |  |  |

## Comment:

At the line $p(6)$, we see that from the Action (a) we have to increment the section. But 2 already excists in the cs list, so we increment To the value 3 . This is quite a tricky one to spot. See the yellow flags.

At the line $p(15)$ we have to decrement the section from value 6 down. Value 5 is in the cs list, so we Decrement to value 4 . See the green flags.
Solution:

| Sector (s) | Primitives (p) | Area (a) | Cw |  |
| :--- | :--- | :--- | :--- | :--- |
| 0 | $0,18,19$ | $<0$ |  | Ccw |
| 1 | $1,5,17$ | $>0$ | X |  |
| 2 | $2,3,4$ | $<0$ |  |  |
| 3 | 6,16 | $<0$ |  |  |
| 4 | $7,11,15$ | $>0$ |  |  |
| 5 | $8,9,10$ | $<0$ |  | X |
| 6 | $12,13,14$ | $<0$ |  | X |
