

iBE Motors

Complete, Intelligent Motion in a Compact Package

The iBE is an entire servo motion control system in a single package, combining a servo motor drive, controller and I/O, and packing it into the back of a high-quality brushless servo motor. Motors are currently offered in NEMA 23 and 34 frame sizes.

Features

Performance

- Single-axis package motor/drive/controller
- 37-330 oz-in continuous torque
- Brushless DC servo motor
- Operates in position, velocity or torque mode
- Dual-encoder capability
- Limit switch inputs
- 7 programmable inputs or outputs

Language

- Easy Windows® software interface - iWare
- EEPROM for 32K of user program storage
- Multiple modes including camming and step & direction
- Infinite ratio gearing
- Change parameters on the fly

Protection

- Software current limit
- Thermal protection

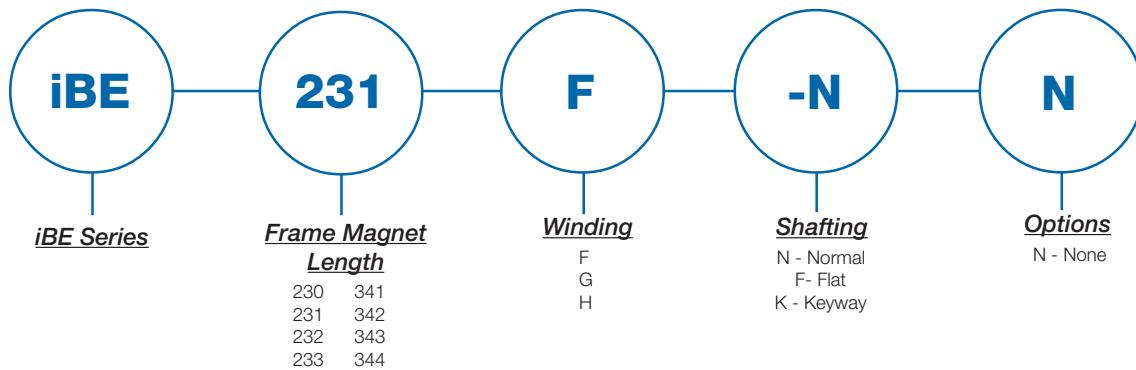

Physical

- Single 24-48 VDC voltage input
- Battery operation is possible

Connectivity

- RS232/RS485 port

Motor Part Numbering System

iBE Capabilities

- **Coordinated motion**

iBE motors can be daisy-chained over RS232 or linked via RS485 to coordinate motion and automate multi-axis machines. Position, velocity and acceleration can be precisely controlled to within 32 bits of resolution.

- **Torque and velocity control**

The iBE provides highly controllable, continuous torque, completely independent of position. Velocity, acceleration and deceleration can be modified on the fly.

- **Encoder following**

The iBE will follow an external encoder with virtually any gearing ratio. While the motor is performing electronic gearing, it can also run its internal program interpreter and communicate with peripherals. An external encoder can also be used to increment and decrement the internal 32-bit counter for later use within the application program.

- **Cam following**

Load a cam table for high-speed cam following with interpolation between table entries.

- **On-the-fly motion-parameter control**

All motion parameters are accessible before, during or after any move. Position, velocity, acceleration and tuning gains can all be changed continuously during motion. No stopping is necessary for perfect 32-bit profiling.

- **Intelligent communications**

The iBE's second RS485 port can be used to talk to intelligent peripherals like MFCs, light curtains, bar code readers, absolute encoders or even additional iBEs; in fact, the iBE can communicate with virtually any serially addressable device.

- **Stepper replacement**

Throughput on machines using traditional stepper or microstepper motors can be dramatically increased by replacing existing stepper axes with iBE motors.

- **Device connectivity**

The iBE has internal analog and digital I/O. For communications, the iBE offers RS232 and RS485 protocols.

- **Multi-node networking**

Multiple axes of iBE motors—up to 100—can be networked together without the usual hassle of encoder and drive cables. In addition, all home and limit sensors can be connected directly to the motors, reducing cabling to an unprecedented level of simplicity.

- **Configuration replication**

The iBE's unique all-digital, downloadable programming methodology means that each system's tuning and performance parameters can be exactly replicated. The user need never tune a servo again.

1 @40°C ambient derate phase currents and torques by 7%.

2 For higher speed operation please call the factory.

3 Measured Line to Line, +/- 10%.

4 Value is measured peak of sine wave.

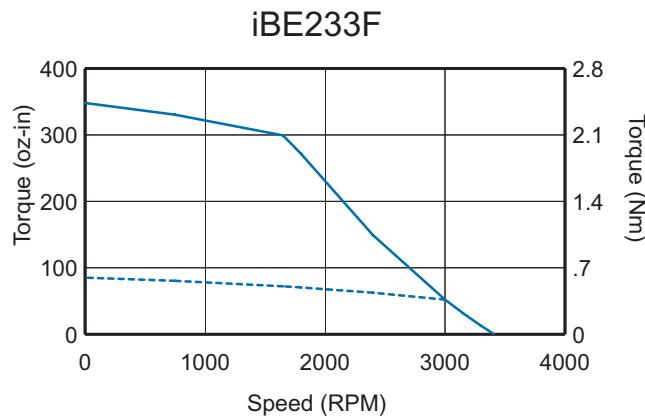

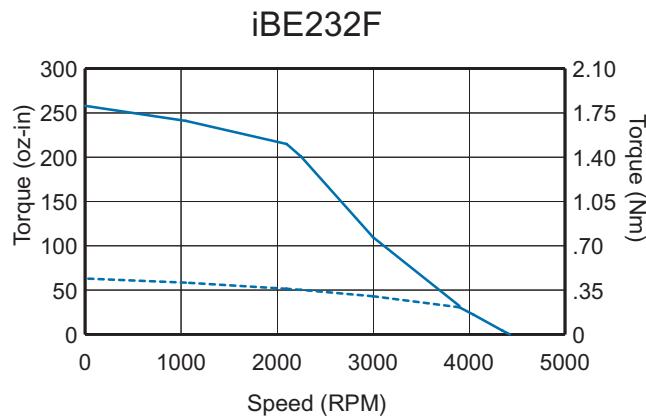

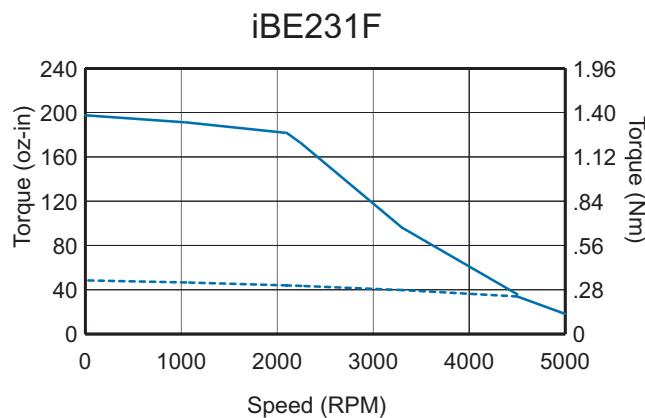

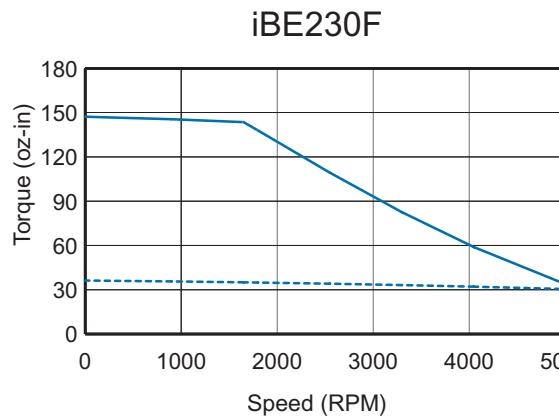

5 Initial winding temperature must be 60°C or less before Peak Current is applied.

6 Total motor torque per peak of the sinusoidal amps measured in any phase, +/-10%.

7 Maximum Time duration with 2 times (or 3 times) rated current applied with initial winding temp at 60°C.

8 48VDC nominal, 52VDC maximum (a 48VDC supply may run up to 10% high = 52VDC).
